

Pen turning has always attracted woodworkers with a taste for highly finished, eye-catching work.

The choice of materials available are wide and varied and while timber species remain popular there is an ever-increasing variety of manmade acrylic and resin blanks available.

The set consists of 2 blades: a spindle roughing gouge and a tipped HSS Cutter (827C) tool along with the longer aluminium handle from the Robert Sorby Modular Micro Tool System.

MADE IN SHEFFIELD

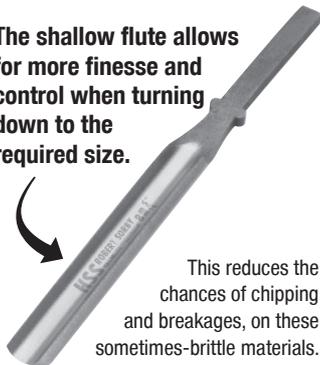

# Robert Sorby

**1** The longer aluminium handle allows you a little more stability which is desirable when turning manmade materials.

**2** The 8mm spindle roughing gouge has a shallower flute than a traditional roughing gouge.

The shallow flute allows for more finesse and control when turning down to the required size.

This reduces the chances of chipping and breakages, on these sometimes-brittle materials.

## 3 Piece Micro Resin Penturning Kit

**3** The cutter has 4 cutting edges which means you can easily rotate it up to 3 times giving you a fresh edge before having to sharpen.

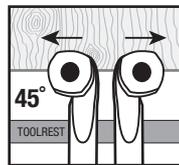

The cutter has radiused cutting edges for ease of use.

We recommend sharpening the cutter with a diamond file (RS224) flat across the top surface.

Having turned the blank round, using the 8mm spindle roughing gouge, use the tipped shear cutter to finely reduce the blank down to your bushings.

Using the tipped tool on a 45° angle enables you to produce controlled fine shear scraping cuts, again, reducing the possibility of the blank chipping, or breaking and giving a superb surface finish.

This set will ensure you have an improved experience when turning manmade materials and produce quality finished pens with ease.

Always use eye protection and a form of dust mask as well as an air cleaner and dust extractor when doing any form of woodworking.
